

The Whitson logo consists of the word "whitson" in a bold, dark blue, sans-serif font, centered within a white rectangular box. The background of the slide features a dark blue overlay with silhouettes of an oil pumpjack and a wellhead against a lighter, textured background.

Numerical RTA: Commonly Observed LFP Trends in Bowie Diagnostic Plot

Mohamad Majzoub Dahouk

Numerical RTA JIP

Knowledge Sharing Session # 1

23 March 2022

Why are we here? To talk Bowie & LFPs

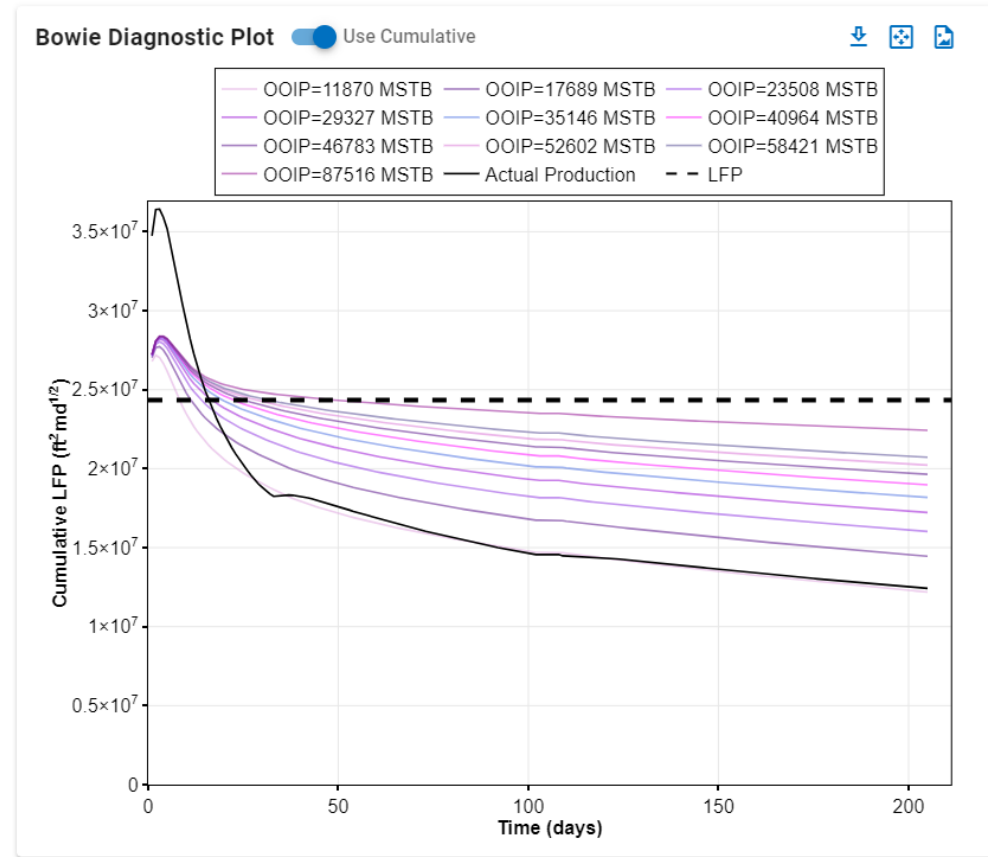

$$LFP = LFP = 4n_f x_f h \sqrt{k}$$

Why are we here? To talk Bowie & LFP

90%

10%

Theory Reminder: “Bowie Workflow”

Step 3. Calculate the ratio between the actual measured oil rates and infinite acting model oil rates: $r = q_{o,actual}/q_{o,IA}$

Reality Reminder: “Bowie Workflow”

Step 3. Calculate the ratio between the actual measured oil rates and infinite acting model oil rates: $r = q_{o,actual}/q_{o,IA}$

SPE Data Repository Well # 4

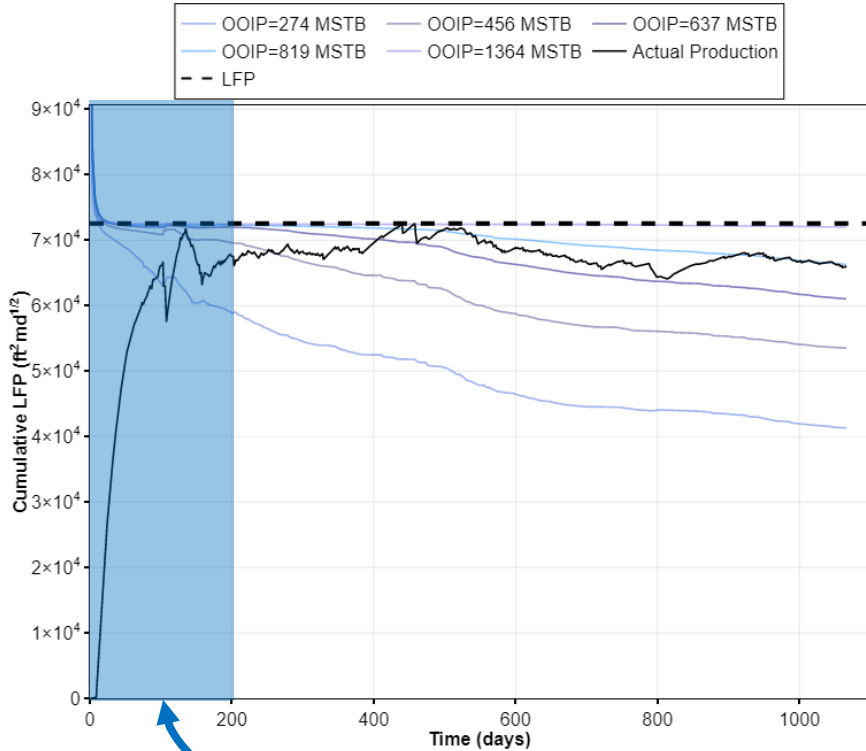

SPE Data Repository Well # 4

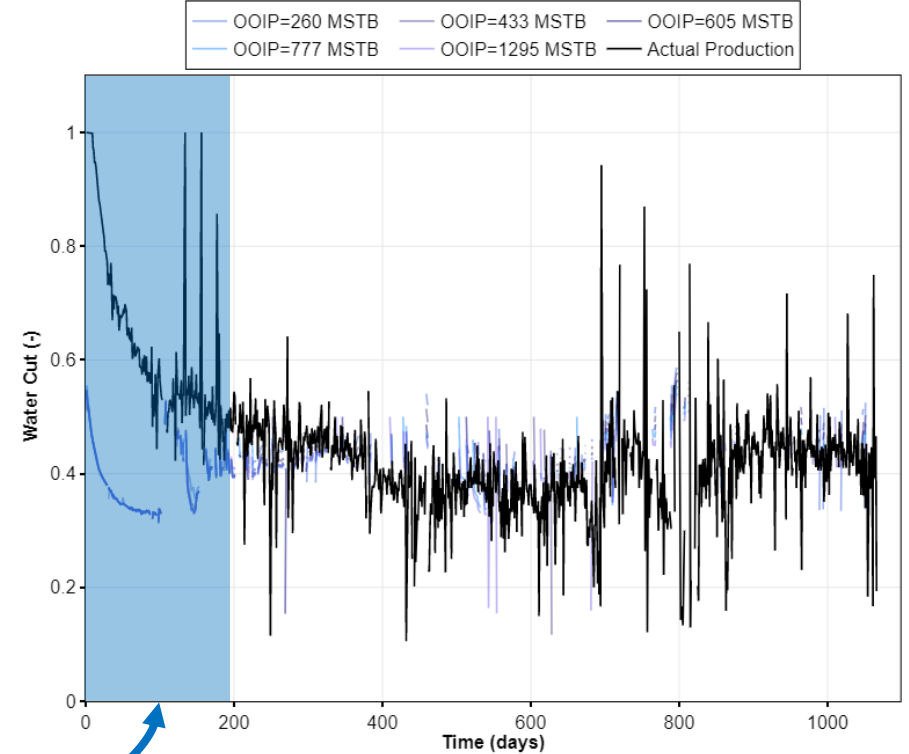

SPE Data Repository Well # 4

Bowie Diagnostic Plot Use Cumulative

Water Cut Use Cumulative

What else can affect the LFP plot?

Anything that would make $q_{\text{model}} > q_{\text{actual}}$

We will study two important ones:

- Initial reservoir pressure
- Dimensionless fracture conductivity (Fcd)

Effect of Initial Reservoir Pressure

Synthetic Well

Well & Reservoir Data

h : 200 ft k_m : 200 md
 h_e : 200 ft ϕ_{mi} : 0.05
 x_e : 400 ft F_{cd} : 1000
 x_f : 400 ft k_{effr} : -
 L_w : 6000 ft y_{effr} : -
 N_f : 40 y_e : 75 ft

Fluid Initialization

GOR_0 : 1000 scf/STB
 S_{wi} : 30 %
 T_R : 250 F
 p_{Ri} : 8000 psia

Matrix Relative Permeability

S_{wc} : 20.00 % S_{orw} : 20.00 %
 S_{org} : 20.00 % S_{gc} : 5.00 %
 n_{wi} : 2 n_{ow} : 2
 n_g : 2 n_{og} : 2
 k_{rwro} : 1 k_{rcrw} : 1
 k_{rgro} : 1

Bottomhole Pressure

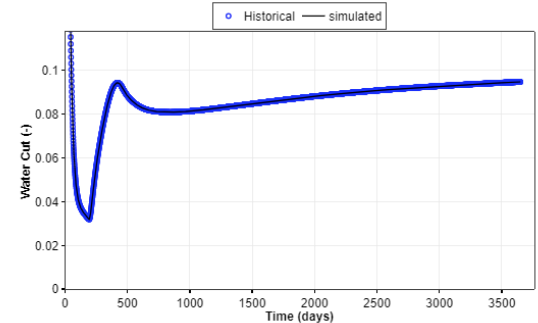

Oil-Gas Ratio

Use Cumulative OGR

Water Cut

Use Cumulative

Higher Reservoir Pressure

Actual P_i = 8000 psia
 P_i in NRTA = 9000 psia

**Model Production >
Actual Production**

Lower Reservoir Pressure

Actual Pi = 8000 psia
Pi in NRTA = 7000 psia

**Model Production <
Actual Production**

Correct Reservoir Pressure

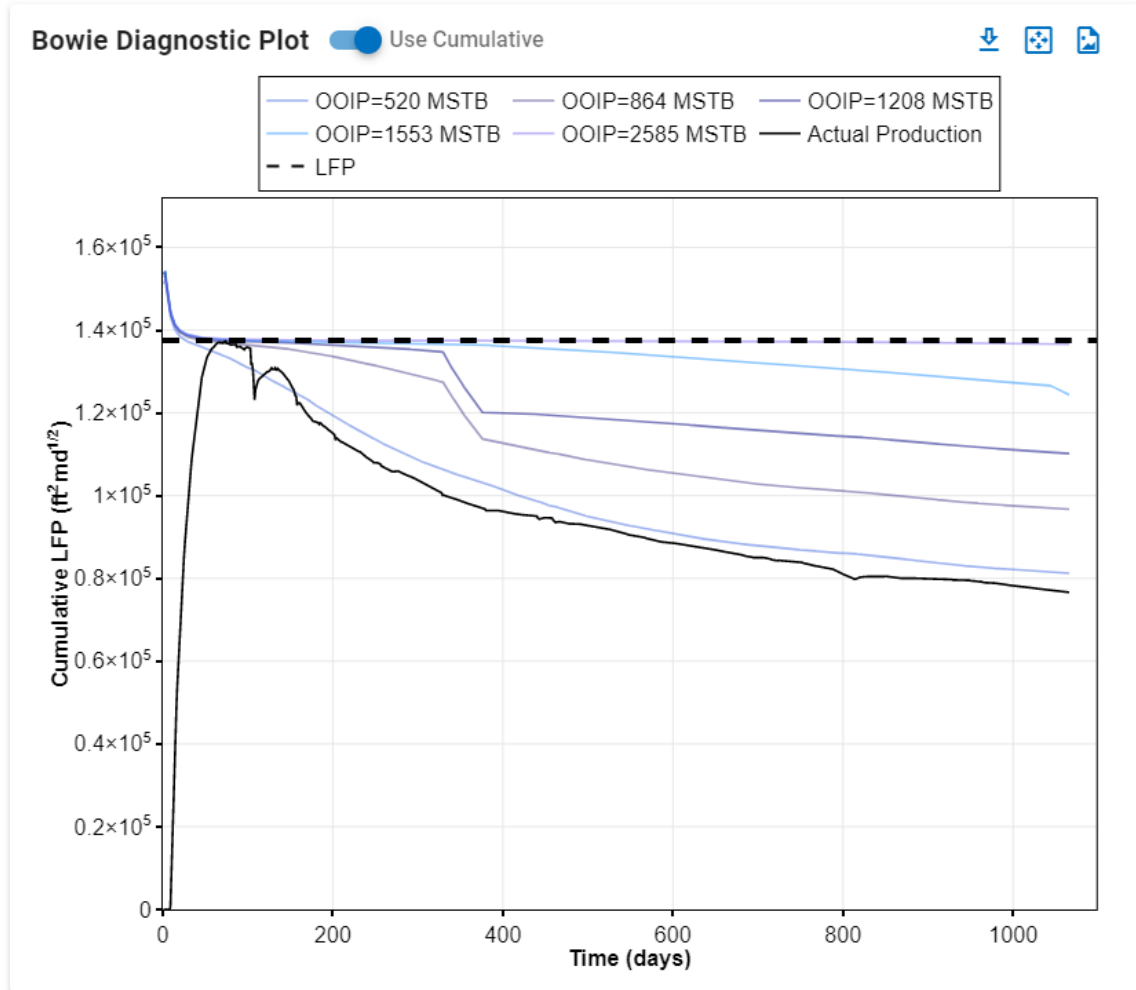

Actual Pi = 8000 psia
Pi in NRTA = 8000 psia

**Model Production =
Actual Production**

Effect of Fcd

SPE Data Repository Well # 4

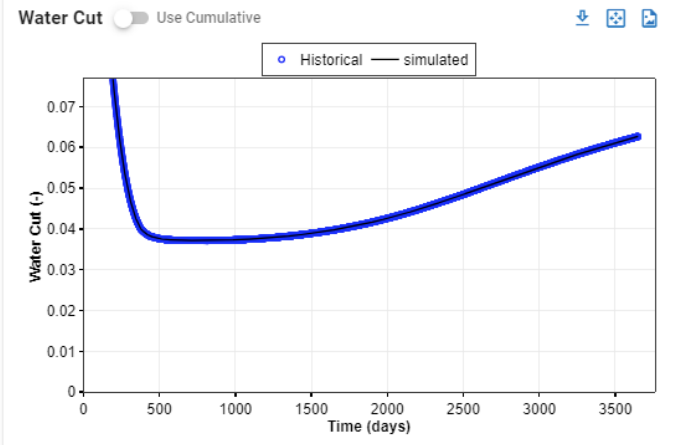

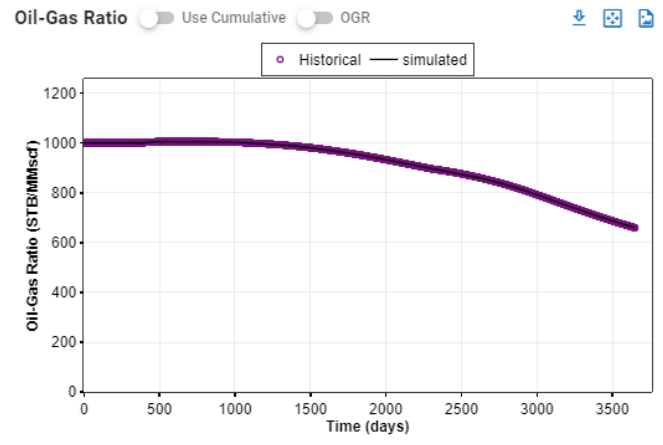

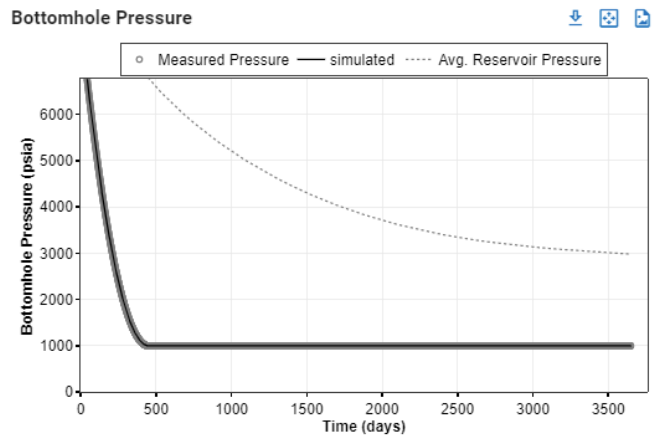

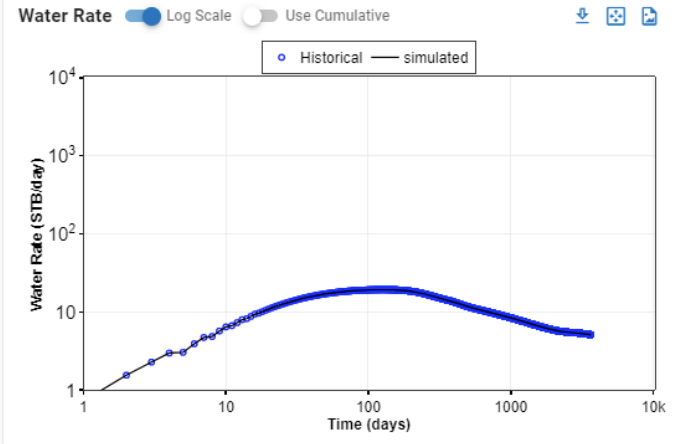

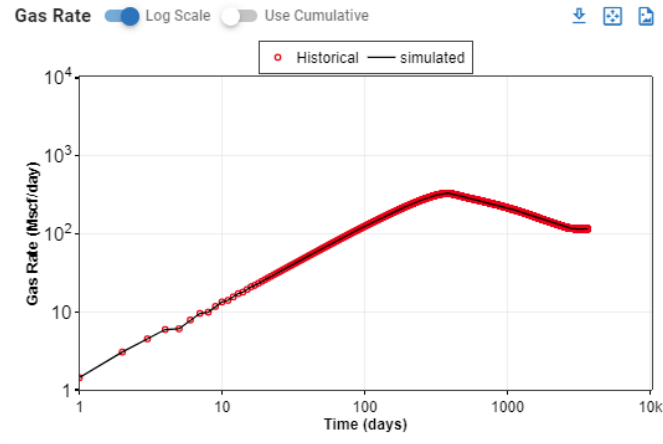

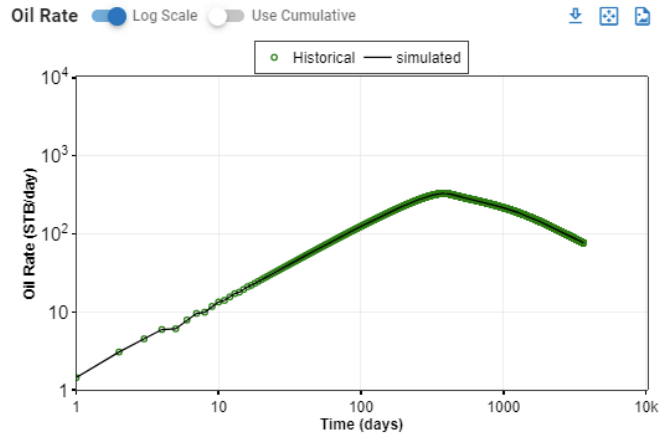

Lowering Fcd makes the “shooting up” period shorter, but in this case results in a very poor match of the rest of the data

Synthetic Low Fcd Well | Fcd = 5

Original Oil in Place

Low Fcd Well, using Correct Fcd = 5

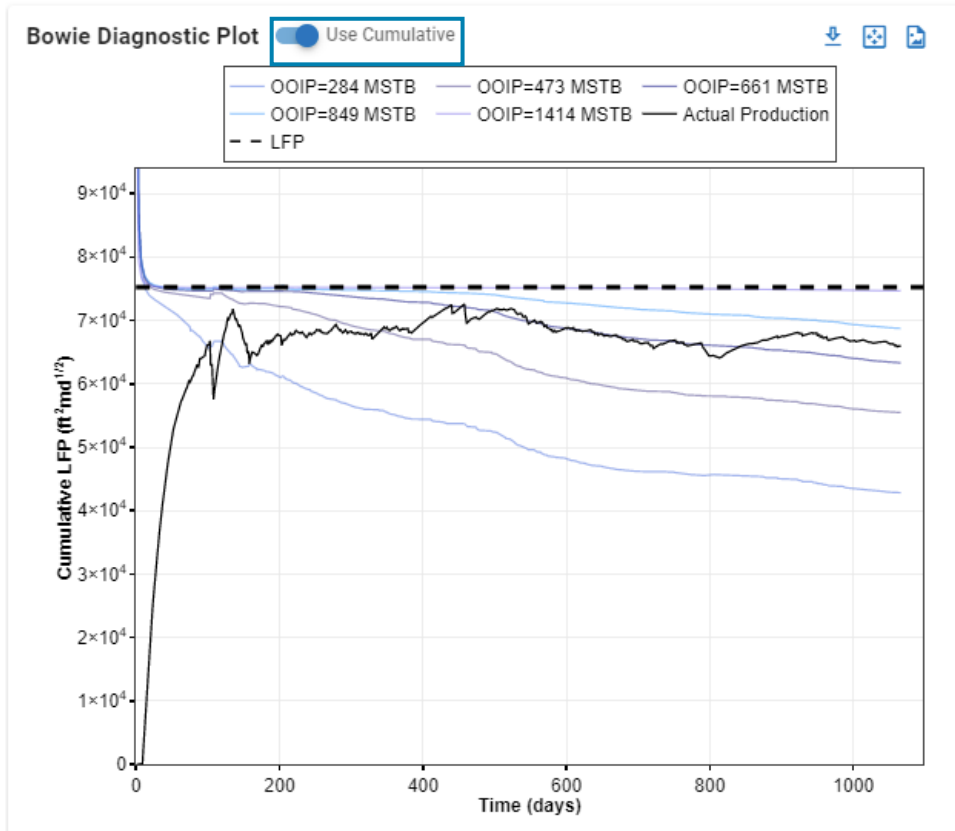

Cum LFP
VS
Instantaneous LFP

Cum LFP vs Instantaneous LFP

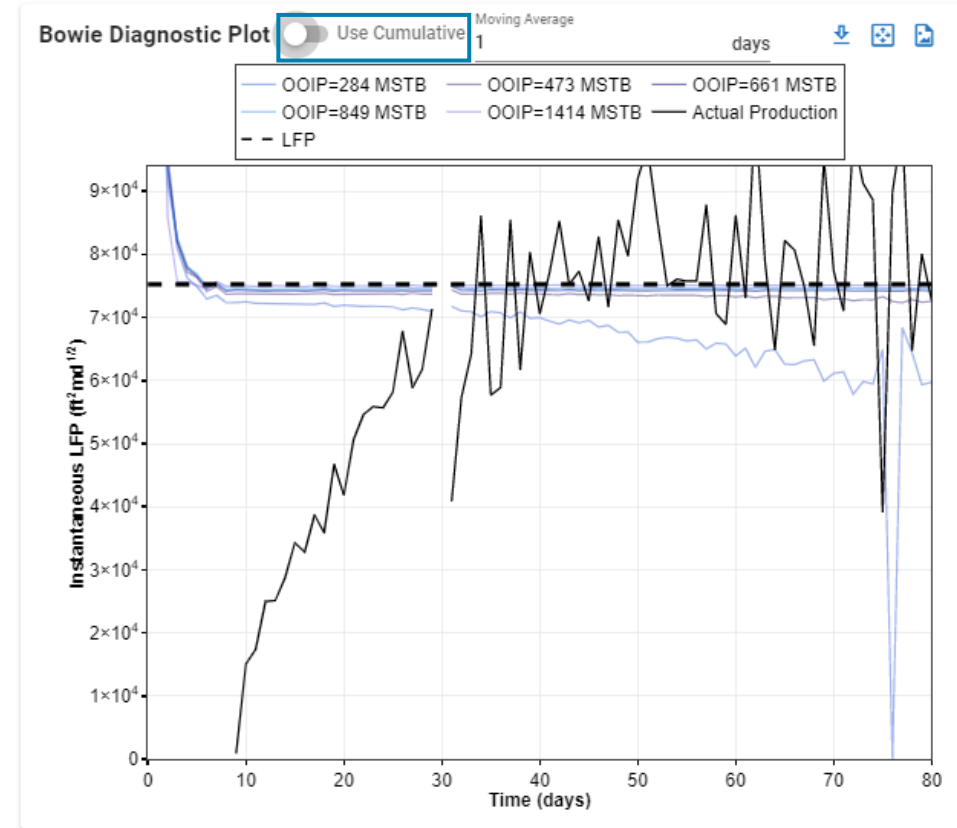

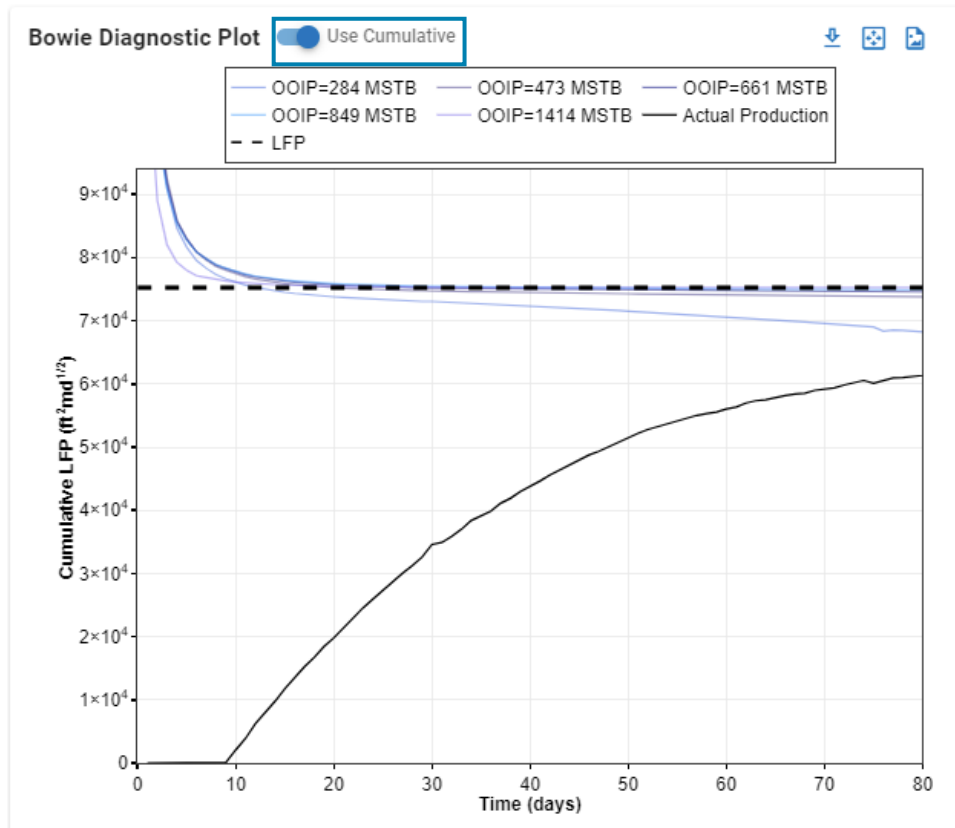

In theory both should show the same results.

Cum LFP vs Instantaneous LFP

In theory both should show the same results.
In practice, cum LFP helps removing “noise”.

Cum LFP vs Instantaneous LFP

In theory both should show the same results.

In practice, cum LFP helps removing “noise”.

BUT, cum LFP will be “delayed” due to early-time climbing LFPs

→ Most important when Cum LFP is still increasing

Concluding Remarks

Concluding Remarks

Early “climbing” LFP behavior expected whenever the production from the model is larger than the actual production.

Concluding Remarks

Early “climbing” LFP behavior $\rightarrow q_{\text{model}} > q_{\text{actual}}$

1. While the well is producing at decreasing water ratio
2. $F_{\text{cd, model}} > F_{\text{cd, well}}$
3. $p_{\text{i, model}} > p_{\text{i, well}}$

And finally:

Cum LFP not always = Instantaneous LFP
